It considers the numerous ways in which physical factors and forces have affected the evolution of life on Earth. There are 20 papers and, because of their interdisciplinary nature, the editors have sensibly asked each of the authors to begin with a summary of basic information on their subject, before considering the latest advances in the field. Inevitably some have done this more ...

Evolution of Earth. The evolution of this planet and its atmosphere gave rise to life, which shaped Earth's subsequent development. Our future lies in interpreting this geologic past and ...

### **Evolution of Earth - Scientific American**

The Earth is estimated to be about 4.6 billion years old. There is no doubt that in that very large amount of time, the Earth has undergone some drastic changes. This means that life on Earth has had to accumulate adaptations as well in order to survive. These physical changes to Earth can drive evolution as the species that are on the planet change as the planet itself changes. The changes on Earth can come from internal or external sources and are continuing to this day.

The history of Earth concerns the development of planet Earth from its formation to the present day. Nearly all branches of natural science have contributed to understanding of the main events of Earth's past, characterized by constant geological change and biological evolution.. The geological time scale (GTS), as defined by international convention, depicts the large spans of time from the ...

Still earlier in its history, Earth was subject to even larger impacts from the leftover debris of planet formation. We know that the Moon was struck repeatedly by objects larger than 100 kilometers in diameter—1000 times more massive than the object that wiped out most terrestrial life 65 million years ago. Earth must have experienced similar large impacts during its first 700 million years of existence. Some of them were probably violent enough to strip the planet of most its atmosphere ...

An impact event is a collision between astronomical objects causing measurable effects. Impact events have physical consequences and have been found to regularly occur in planetary systems, though the most frequent involve asteroids, comets or meteoroids and have minimal effect. When large objects impact terrestrial planets such as the Earth, there can be significant physical and biospheric ...
