In fuzzy mathematics, fuzzy logic is a form of many-valued logic in which the truth values of variables may be any real number between 0 and 1 both inclusive. It is employed to handle the concept of partial truth, where the truth value may range between completely true and completely false. By contrast, in Boolean logic, the truth values of variables may only be the integer values 0 or 1. The term fuzzy logic was introduced with the 1965 proposal of fuzzy set theory by Lotfi Zadeh ...

Fuzzy Logic is a logic or control system of an n-valued logic system which uses the degrees of state "degrees of truth" of the inputs and produces outputs which depend on the states of the inputs and rate of change of these states (rather than the usual "true or false" (1 or 0), Low or High Boolean logic (Binary) on which the modern computer is based).

Zadeh's fuzzy logic joined a growing chorus of computational techniques introduced during this period that were collected under the mantle of "connectionism," a term with origins in neuroscience. This signaled a new paradigm, in which AI applications are effective insofar as they are unstable models of an unstable world, with each new input modifying and progressively updating the overall model itself. Bayesian networks — the breakthrough technique developed by UCLA computer ...
